

Instructions

Please only use a type of fuel suitable for fire juggling / breathing etc which has a low burn temperature. (In the UK liquid paraffin or lamp oil is often used for this purpose)

Soak the wicks in fuel, preferably using a dropper etc, and shake off excess liquid (away from the area you will be diaboloing in) before lighting.

The diabolo can be wicked in many different ways but we advise keeping the heat away from the central bearing parts where possible. Below is our preferred wicking method. You can add more or less using the various holes in the cups with wire or Kevlar string to attach the wick

Please put the fire out when not using and do not leave a burning diabolo standing upright (on one cup) as the flames will burn upwards directly into the bearing parts which can be damaged this way.

Be safe and enjoy. We do not advise this item is used by anyone under the age of 16 without adult supervision.
